1. New Features in Minitab Model Ops 1.4

Backdating Warnings

Minitab Model Ops can only store prediction results during the timeframes for which the current champion model was the deployment champion model. Therefore, when you submit a request for dates when another model was the champion, Model Ops now provides a warning that prediction results for those rows cannot be logged.

Retain User Session Settings

Minitab Model Ops will remember user settings within and between sessions. Each control has a default setting with a new subscription; however, when page settings, filter settings, and sort order are changed by the user, they are retained for each user.

2. Problems Resolved in Minitab Model Ops 1.4

The following issues are resolved in Minitab Model Ops 1.4.

- We now allow the selection of the next day (tomorrow) in the Date Picker when the time is after the SOD of the next day, according to the deployment's time zone. (250144)
- Updated the deployment-worker sequence of deleting and teardown of deployments to ensure complete undeployment of subscription containers. (259270)
